

Identification

- Title: Low Volatility Asset Valuation in Brazilian Stock Market: Lower Risk with Higher Returns
- Authors:
 - Luciano Boudjoukian França
 - Mario Candido de Avelar Fernandes Filho
 - Pedro Paulo Portella Teles
- Date: June 2022

Folder Contents

- raw_data/cdi_raw.xlsx: data about the risk-free rate; extracted from the Brazilian Central Bank.
- raw_data/index_comp_raw.xlsx: IBX composition by month; extracted from the Bloomberg Terminal.
- raw_data/indicators_raw.xlsx: financial indicators of all companies that are or were part of the IBX index; extracted from the Bloomberg Terminal.
- raw_data/price_raw.xlsx: price of all companies that are or were part of the IBX index; extracted from the Bloomberg Terminal.
- 00_setup.R: script to install and load all the required packages (latest version).
- 01_clean_data.R: takes the raw data and clean it. This cleaned data will be stored as .csv files in a folder called “Brazil”.
- 02_backtests.R: takes the clean data, source the “functions.R” file and runs the backtests. The portfolios will be stored as .csv files in a folder called “Portfolios”.
- 03_main_code.R: take the clean data, the portfolio returns, and returns a .xlsx file containing all the tables used in the article.
- 99_functions.R: set of functions that are going to be used to run the backtests. It will be sourced from the other scripts.
- draft_manuscript.pdf: Draft Manuscript

Data Availability Statement

All the Excel files used to suport the findings of this study have been deposited in the “raw_data” folder.

Computational Requirements

R 4.1.1 [64-bit]

The file “00_setup.R” will install all dependencies (latest version), and should be run once prior to running other programs .R. For more information, check the “Instructions” section.

- pacman (0.5.1)
- tidyverse (1.3.1)
- xts (0.12.1)
- lubridate (1.8.0)
- PerformanceAnalytics (2.0.4)
- parallel (4.1.1)
- furr (0.3.0)
- readxl (1.4.0)
- writexl (1.4.0)

The code was last run on a 4 core 11th Gen Intel Core i7-1165G7 laptop, with Windows version 11, 16 GB of RAM, and 512GB of SSD. Computation took 10 minutes.

Instructions

First, make sure that you have R installed and that you have the folder containing the R codes as your working directory.

Then, the code should be run in the following order:

- 1- 00_setup.R: install and load all dependencies (latest version);
- 2- 01_clean_data.R: create folder ‘brazil’ containing the cleaned data;
- 3- 02_backtests.R: create folder ‘portfolios’ containing the portfolios returns that will be used to generate the figures and tables;
- 4- 03_main_code.R: generate all the tables and figures used in the article.

No further action is needed on the replicator’s part.

Following the procedure described above, allows the replicator to access all the figures and tables using R through the variables. The name of each variable indicates if it refers to a figure (“fig”) or a table (“tb”) and the number of the figure or table. If it’s a table, it also indicates which panel (“panel_”). In this case, “tb5_panel_d” means “Table 5 - Panel D” and “fig1” means “Figure 1”, for example.
